HTML TIPS & TRICKS

REMOVE CELL PADDING

```
$pdf->SetCellPadding(0);
```

This is used to remove any additional vertical space inside a single cell of text.

REMOVE TAG TOP AND BOTTOM MARGINS

```
$tagvs = array('p' => array(0 => array('h' => 0, 'n' => 0), 1 => array('h' => 0, 'n' => 0)));  
$pdf->setHtmlVSpace($tagvs);
```

Since the CSS margin command is not yet implemented on TCPDF, you need to set the spacing of block tags using the following method.

SET LINE HEIGHT

```
$pdf->setCellHeightRatio(1.25);
```

You can use the following method to fine tune the line height (the number is a percentage relative to font height).

CHANGE THE PIXEL CONVERSION RATIO

```
$pdf->setImageScale(0.47);
```

This is used to adjust the conversion ratio between pixels and document units. Increase the value to get smaller objects.

Since you are using pixel unit, this method is important to set the right zoom factor.

Suppose that you want to print a web page larger 1024 pixels to fill all the available page width.

An A4 page is larger 210mm equivalent to 8.268 inches, if you subtract 13mm (0.512") of margins for each side, the remaining space is 184mm (7.244 inches).

The default resolution for a PDF document is 300 DPI (dots per inch), so you have $7.244 * 300 = 2173.2$ dots (this is the maximum number of points you can print at 300 DPI for the given width).

The conversion ratio is approximately $1024 / 2173.2 = 0.47$ px/dots

If the web page is larger 1280 pixels, on the same A4 page the conversion ratio to use is $1280 / 2173.2 = 0.59$ pixels/dots
